## CS-I 84: Computer Graphics

## Lecture \#4:2DTransformations

## Prof. James O'Brien

University of California, Berkeley
volisat 10

|  | Introduction |
| :--- | :--- |
| - Transformation: |  |
| An operation that changes one configuration into another |  |
| - For images, shapes, etc. |  |
| A geometrit transformation maps positions that define the object to |  |
| other positions |  |
| Linear transformation means the transformation is defined by a linear |  |
| function... which is what matrices are good for. |  |$\quad 3$

## Some Examples

Original

Sunday, February 3, 13

[^0]

Sunday, February 3, 13

|  | Linear is Linear |
| :--- | :--- |
|  | - Polygons defined by points |
| - Edges defined by interpolation between two points |  |
| - Interior defined by interpolation between all points |  |
| - Linear interpolation |  |

|  | Linear is Linear |
| :--- | :--- |
| - Composing two linear function is still linear |  |
| - Transform polygon by transforming vertices |  |
| Sunday, February 3,13 Scale |  |

## Linear is Linear

- Composing two linear function is still linear
- Transform polygon by transforming vertices

$$
\begin{aligned}
& f(x)=a+b x \quad g(f)=c+d f \\
& g(x)=c+d f(x)=c+a d+b d x
\end{aligned}
$$

$$
g(x)=a^{\prime}+b^{\prime} x
$$

|  | Points in Space <br> - Represent point in space by vector in $R^{n}$ <br> • Relative to some origin! <br> - Relative to some coordinate axes! <br> - The choice of coordinate system is arbitrary and should be convenient. |
| :--- | :--- |
| Later we'll add something extra... |  |

## Basic Transformations

- Basic transforms are: rotate, scale, and translate
-Shear is a composite transformation!
Translate
17

Linear Functions in 2D

$$
\begin{gathered}
x^{\prime}=f(x, y)=c_{1}+c_{2} x+c_{3} y \\
y^{\prime}=f(x, y)=d_{1}+d_{2} x+d_{3} y \\
{\left[\begin{array}{c}
x^{\prime} \\
y^{\prime}
\end{array}\right]=\left[\begin{array}{l}
t_{x} \\
t_{y}
\end{array}\right]+\left[\begin{array}{ll}
M_{x x} & M_{x y} \\
M_{y x} & M_{y y}
\end{array}\right] \cdot\left[\begin{array}{l}
x \\
y
\end{array}\right]} \\
\mathbf{x}^{\prime}=\mathbf{t}+\mathbf{M} \cdot \mathbf{x}
\end{gathered}
$$

|  | Rotations |
| :--- | :--- |
|  |  |
|  | Preserve lengths and distance to origin |
|  | Rotation matrices are orthonormal |
| $\cdot$ | $\operatorname{Det}(\mathbf{R})=1 \neq-1$ |
| $\cdot$ | In 2D rotations commute... |
| $\cdot$ | But in 3D they won't! |

|  | ScaleS |
| :--- | :--- |
|  | Diagonal matrices <br> - Diagonal parts are scale in $X$ and scale in $Y$ directions <br> - Negative values flip <br> - Two negatives make a positive (I80 deg. rotation) <br> - Really, axis-aligned scales |

- Shears are not really primitive transforms
- Related to non-axis-aligned scales
- More shortly.....

## Translation

- This is the not-so-useful way:
$\leadsto \rightarrow \bigwedge \quad \mathbf{p}^{\prime}=\mathbf{p}+\left[\begin{array}{l}t_{x} \\ t_{y}\end{array}\right]$
Translate

Note that its not like the others.

## Arbitrary Matrices

- For everything but translations we have:

$$
\mathbf{x}^{\prime}=\mathbf{A} \cdot \mathbf{x}
$$

- Soon, translations will be assimilated as well
-What does an arbitrary matrix mean?

## Singular Value Decomposition

- For any matrix, $\mathbf{A}$, we can write SVD:

$$
\mathbf{A}=\mathbf{Q S R}^{\top}
$$

where $\mathbf{Q}$ and $\mathbf{R}$ are orthonormal and $\mathbf{S}$ is diagonal

- Can also write Polar Decomposition

$$
\mathbf{A}=\mathbf{P R S R}^{\top}
$$

where $\mathbf{P}$ is also orthonormal $\mathbf{P}=\mathbf{Q R}^{\top}$

## Decomposing Matrices

- We can force $\mathbf{P}$ and $\mathbf{R}$ to have Det=1 so they are rotations
- Any matrix is now:
- Rotation:Rotation:Scale:Rotation
- See, shear is just a mix of rotations and scales

## Composition

- Matrix multiplication composites matrices

$$
\mathbf{p}^{\prime}=\mathbf{B A p}
$$

"Apply $\mathbf{A}$ to $\mathbf{p}$ and then apply $\mathbf{B}$ to that result."

$$
\mathbf{p}^{\prime}=\mathbf{B}(\mathbf{A p})=(\mathbf{B A}) \mathbf{p}=\mathbf{C} \mathbf{p}
$$

- Several translations composted to one
- Translations still left out...

$$
\mathbf{p}^{\prime}=\mathbf{B}(\mathbf{A p}+\mathbf{t})=\mathbf{p}+\mathbf{B t}=\mathbf{C p}+\mathbf{u}
$$

## Homogeneous Coordinates

- Move to one higher dimensional space
- Append a 1 at the end of the vectors

$$
\mathbf{p}=\left[\begin{array}{l}
p_{x} \\
p_{y}
\end{array}\right] \quad \widetilde{\mathbf{p}}=\left[\begin{array}{c}
p_{x} \\
p_{y} \\
1
\end{array}\right]
$$

- For directions the extra coordinate is a zero

| Homogeneous Translatio |
| :---: |
| $\widetilde{\mathbf{p}}^{\prime}=\left[\begin{array}{lll}1 & 0 & t_{x} \\ 0 & 1 & t_{y} \\ 0 & 0 & 1\end{array}\right]\left[\begin{array}{c}p_{x} \\ p_{y} \\ 1\end{array}\right]$ |
| $\widetilde{\mathbf{p}}^{\prime}=\widetilde{\mathbf{A}} \widetilde{\mathbf{p}}$ |
| The tildes are for clarity to |

The tildes are for clarity to distinguish homogenized from non-homogenized vectors.

|  | Rotate About Arb. Point |
| :--- | :--- |
|  | - Step 1:Translate point to origin |
| - Step 2: Rotate as desired |  |
| - Step 3: Put back where it was |  |
| Don't negate the $1 \ldots$. |  |

| Scale About Arb. Axis |
| :--- |
| - Diagonal matrices scale about coordinate axes only: |

## Scale About Arb. Axis

- Step I:Translate axis to origin
- Step 2: Rotate axis to align with one of the coordinate axes

|  | Scale About Arb. Axis |
| :--- | :--- |
| - Step 1:Translate axis to origin |  |
| axes 2: Rotate axis to align with one of the coordinate |  |
| - Step 3: Scale as desired |  |

|  | Scale About Arb. Axis |
| :--- | :--- |
|  | Step I:Translate axis to origin <br> - Step 2: Rotate axis to align with one of the coordinate <br> axes <br> - Step 3: Scale as desired <br> - Steps 4\&5: Undo 2 and I (reverse order) |

|  | Order Matters! |
| :--- | :--- |
|  |  |
| - The order that matrices appear in matters |  |
| $\mathbf{A} \cdot \mathbf{B} \neq \mathbf{B A}$ |  |
| - Some special cases work, but they are special |  |
| - But matrices are associative |  |
| $(\mathbf{A} \cdot \mathbf{B}) \cdot \mathbf{C}=\mathbf{A} \cdot(\mathbf{B} \cdot \mathbf{C})$ |  |
| - Think about efficiency when you have many points to |  |
| transform... |  |

## Matrix Inverses

- In general: $\mathbf{A}^{-1}$ undoes effect of $\mathbf{A}$
- Special cases:
- Translation: negate $\boldsymbol{t}_{x}$ and $\boldsymbol{t}_{\boldsymbol{y}}$
- Rotation: transpose
- Scale: invert diagonal (axis-aligned scales)
- Others:
- Invert matrix
- Invert SVD matrices

## PointVectors / Direction Vectors

- Points in space have a 1 for the " $w$ " coordinate
- What should we have for $\mathbf{a}-\mathbf{b}$ ?
- $w=0$
- Directions not the same as positions
- Difference of positions is a direction
- Position + direction is a position
- Direction + direction is a direction
- Position + position is nonsense

## Some Things Require Care

For example normals transform abnormally

$$
\mathbf{n}^{\mathbf{T}} \mathbf{t}=0 \quad \mathbf{t}_{\mathbf{M}}=\mathbf{M t} \quad \text { find } \mathbf{N} \text { such that } \mathbf{n}_{\mathbf{N}}^{\mathbf{T}} \mathbf{t}_{\mathbf{M}}=0
$$

## Some Things Require Care

For example normals transform abnormally

$$
\begin{gathered}
\mathbf{n}^{\mathbf{T}} \mathbf{t}=0 \quad \mathbf{t}_{\mathbf{M}}=\mathbf{M} \mathbf{t} \quad \text { find } \mathbf{N} \text { such that } \mathbf{n}_{\mathbf{N}}^{\mathbf{T}} \mathbf{t}_{\mathbf{M}}=0 \\
\mathbf{n}^{\mathbf{T}} \mathbf{t}=\mathbf{n}^{\mathbf{T}} \mathbf{I t}=\mathbf{n}^{\mathbf{T}} \mathbf{M}^{-\mathbf{1}} \mathbf{M} \mathbf{t}=0
\end{gathered}
$$

## Some Things Require Care

For example normals transform abnormally

$$
\begin{gathered}
\mathbf{n}^{\mathbf{T}} \mathbf{t}=0 \quad \mathbf{t}_{\mathbf{M}}=\mathbf{M} \mathbf{t} \quad \text { find } \mathbf{N} \text { such that } \mathbf{n}_{\mathbf{N}}^{\mathbf{T}} \mathbf{t}_{\mathbf{M}}=0 \\
\mathbf{n}^{\mathbf{T}} \mathbf{t}=\mathbf{n}^{\mathbf{T}} \mathbf{I t}=\mathbf{n}^{\mathbf{T}} \mathbf{M}^{-\mathbf{1}} \mathbf{M} \mathbf{t}=0 \\
\left(\mathbf{n}^{\mathbf{T}} \mathbf{M}^{-\mathbf{1}}\right) \mathbf{t}_{\mathbf{M}}=0 \\
\mathbf{n}_{\mathbf{N}}^{\mathbf{T}}=\mathbf{n}^{\mathbf{T}} \mathbf{M}^{-\mathbf{1}}
\end{gathered}
$$

## Some Things Require Care

For example normals transform abnormally

$$
\begin{gathered}
\mathbf{n}^{\mathbf{T}} \mathbf{t}=0 \quad \mathbf{t}_{\mathbf{M}}=\mathbf{M} \mathbf{t} \quad \text { find } \mathbf{N} \text { such that } \mathbf{n}_{\mathbf{N}}^{\mathrm{T}} \mathbf{t}_{\mathbf{M}}=0 \\
\mathbf{n}^{\mathbf{T}} \mathbf{t}=\mathbf{n}^{\mathbf{T}} \mathbf{I} \mathbf{t}=\mathbf{n}^{\mathbf{T}} \mathbf{M}^{-\mathbf{1}} \mathbf{M} \mathbf{t}=0 \\
\left(\mathbf{n}^{\mathbf{T}} \mathbf{M}^{-\mathbf{1}}\right) \mathbf{t}_{\mathbf{M}}=0 \\
\mathbf{n}_{\mathbf{N}}^{\mathbf{T}}=\mathbf{n}^{\mathbf{T}} \mathbf{M}^{-\mathbf{1}} \\
\mathbf{n}_{\mathbf{N}}=\left(\mathbf{n}^{\mathbf{T}} \mathbf{M}^{\mathbf{1}}\right)^{\mathbf{T}} \\
\mathbf{N}=\left(\mathbf{M}^{-\mathbf{1}}\right)^{\mathbf{T}} \quad \text { See book for details }
\end{gathered}
$$
