CS-184: Computer Graphics Lecture #18: Forward and Inverse Kinematics Prof. James O'Brien University of California, Berkeley	1	
Today • Forward kinematics • Inverse kinematics • Pin joints • Ball joints • Prismatic joints	2	

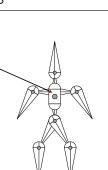

Forward Kinematics

- Articulated skeleton
- Topology (what's connected to what)
- · Geometric relations from joints
- · Independent of display geometry
- Tree structure
- · Loop joints break "tree-ness"

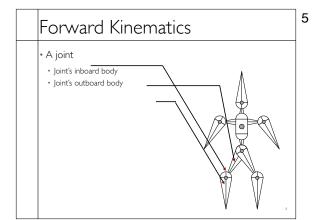

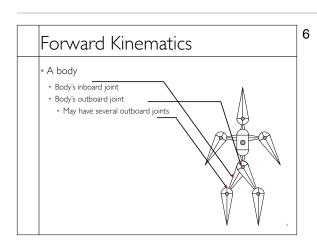

Forward Kinematics

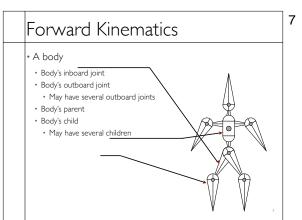

- Root body
- Position set by "global" transformation
- Root joint
- Position
- Rotation
- · Other bodies relative to root
- · Inboard toward the root
- · Outboard away from root

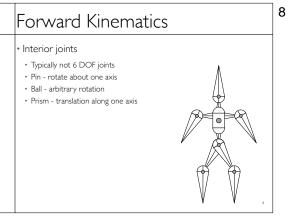

3

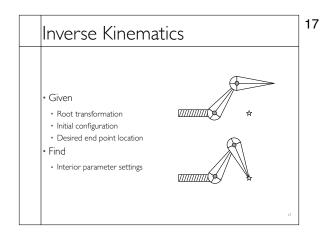

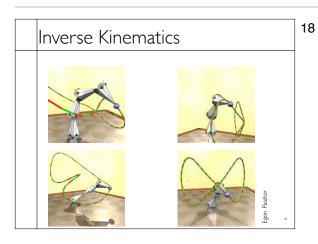

9 Forward Kinematics • Pin Joints Translate inboard joint to local origin · Apply rotation about axis Translate origin to location of joint on outboard body 10 Forward Kinematics Ball Joints Translate inboard joint to local origin · Apply rotation about arbitrary axis Translate origin to location of joint on outboard body

11 Forward Kinematics Prismatic Joints Translate inboard joint to local origin Translate along axis • Translate origin to location of joint on outboard body 12 Forward Kinematics • Composite transformations up the hierarchy

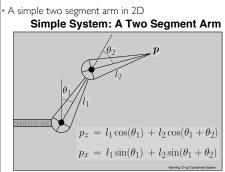

13 Forward Kinematics • Composite transformations up the hierarchy 14 Forward Kinematics • Composite transformations up the hierarchy

15 Forward Kinematics • Composite transformations up the hierarchy 16 Forward Kinematics • Composite transformations up the hierarchy

19

20

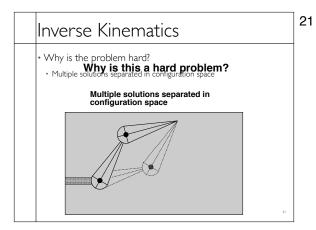

Inverse Kinematics

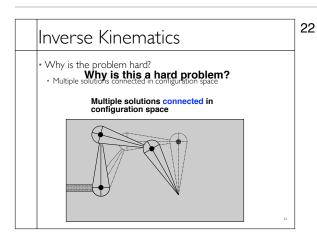

• Direct IK: solve for the parameters

Direct IK: Solve for and

$$\theta_2 = \cos^{-1} \left(\frac{p_z^2 + p_x^2 - l_1^2 - l_2^2}{2l_1 l_2} \right)$$

$$\theta_1 = \frac{-p_z l_2 \sin(\theta_2) + p_x (l_1 + l_2 \cos(\theta_2))}{p_x l_2 \sin(\theta_2) + p_z (l_1 + l_2 \cos(\theta_2))}$$

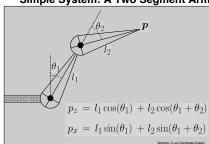

23 Inverse Kinematics • Why is the problem hard? · Solutions may not always exist 24 Inverse Kinematics Numerical Solution Start in some initial configuration • Define an error metric (e.g. goal pos - current pos) Compute Jacobian of error w.r.t. inputs Apply Newton's method (or other procedure) · Iterate...

• Recall simple two segment arm:

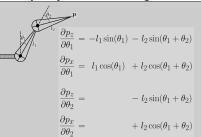

Simple System: A Two Segment Arm

• We can write of the derivatives

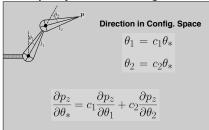

Inverse Kinematics

Simple System: A Two Segment Arm

27

Simple System: A Two Segment Arm

28

The Jacobian (of p w.r.t. θ)

$$J_{ij} = \frac{\partial p_i}{\partial \theta_i}$$

Inverse Kinematics

Example for two segment arm

$$J = \begin{bmatrix} \frac{\partial p_z}{\partial \theta_1} & \frac{\partial p_z}{\partial \theta_2} \\ \frac{\partial p_x}{\partial \theta_1} & \frac{\partial p_x}{\partial \theta_2} \end{bmatrix}$$

29

The Jacobian (of p w.r.t. θ)

$$J = \begin{bmatrix} \frac{\partial p_z}{\partial \theta_1} & \frac{\partial p_z}{\partial \theta_2} \\ \frac{\partial p_x}{\partial \theta_1} & \frac{\partial p_x}{\partial \theta_2} \end{bmatrix}$$

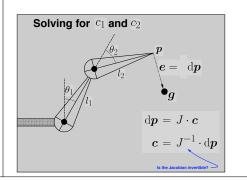

$$\frac{\partial \boldsymbol{p}}{\partial \theta_*} = J \cdot \begin{bmatrix} \frac{\partial \theta_1}{\partial \theta_*} \\ \frac{\partial \theta_2}{\partial \theta_*} \end{bmatrix} = J \cdot \begin{bmatrix} c_1 \\ c_2 \end{bmatrix}$$

Inverse Kinematics

Solving for c_1 and c_2

$$oldsymbol{c} = egin{bmatrix} c_1 \ c_2 \end{bmatrix} \qquad \mathrm{d} oldsymbol{p} = egin{bmatrix} \mathrm{d} p_z \ \mathrm{d} p_x \end{bmatrix}$$

$$d\mathbf{p} = J \cdot \mathbf{c}$$
$$\mathbf{c} = J^{-1} \cdot d\mathbf{p}$$

31

Inverse Kinematics

- Problems
- Jacobian may (will!) not always be invertible
- Use pseudo inverse (SVD)
 Robust Reflection
- Jacobian is Jacobian may (will) not be invertible
- Option #1: Use pseudo inverse (SVD)

 Nonlinear optimization self-transferretts (mostly) well behaved

Non-linear optimization...
but problem is well behaved (mostly)

2	2
J	_
_	

Jacobian is not always invertible

Computing a linear approximation

· Use pseudo inverse (SVD)

- End effector only locally moves linearly
- End effector only locally moves linearly
 Non-linear optimization...
 Not linear optimization...
 but problem is, well behaved (mostly)
 So iterate (choosing proper step size) and update Jacobian after each step)
- Choosing step size requires line search at each step
- Choose some step size (say 5 degrees) and compute how to update joint parameters
- · Calculate distance of end effector from goal
- · If distance decreased take step
- Is distance did not decrease set parameters to be half the current change and try again

Inverse Kinematics

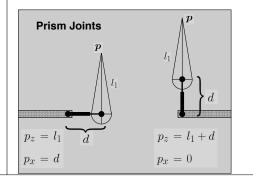

- More complex systems
- More complex joints (prism and ball)
- More links
- Other criteria (COM or height)
- · Hard constraints (joint limits)
- · Multiple criteria and multiple chains

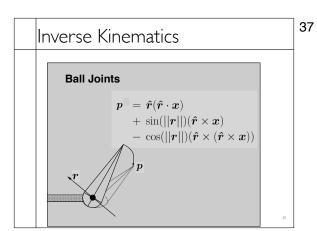

18-Kine	ematics.kev	- Anril 1	5 2014

- Some issues
- · How to pick from multiple solutions?
- Robustness when no solutions
- Contradictory solutions
- Smooth interpolation
- · Interpolation aware of constraints
- Numerical evaluation of Jacobian

35

Inverse	Kinematics
---------	------------

lr	nverse Kinematics	38
	Ball Joints (moving axis)	
	$\mathrm{d}oldsymbol{p} = [\mathrm{d}oldsymbol{r}] \cdot e^{[oldsymbol{r}]} \cdot oldsymbol{x} = [\mathrm{d}oldsymbol{r}] \cdot oldsymbol{p} = -[oldsymbol{p}] \cdot \mathrm{d}oldsymbol{r}$	
	That is the Jacobian for this joint	
	$[m{r}] = \left[egin{array}{ccc} 0 & -r_3 & r_2 \ r_3 & 0 & -r_1 \ -r_2 & r_1 & 0 \end{array} ight]$	

 $[r] \cdot x = r \times x$

39

Ball Joints (fixed axis)

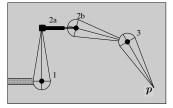

$$\mathrm{d}m{p} = (\mathrm{d} heta)[m{\hat{r}}]\cdotm{x} = -reve{[m{x}]\cdotm{\hat{r}}}\mathrm{d} heta$$

Inverse Kinematics

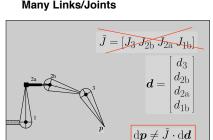

Many links / joints

• Need a gene**Manyddinks/dqints**ian

We need a generic method of building Jacobian

• Can't just concatenate individual matrices **Many Links/Joints**

Inverse Kinematics

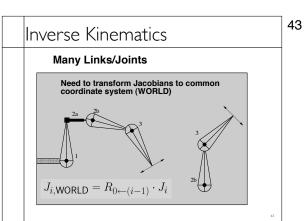

Many Links/Joints

Transformation from body to world

$$X_{0 \leftarrow i} = \prod_{i=1}^{i} X_{(j-1) \leftarrow j} = X_{0 \leftarrow 1} \cdot X_{1 \leftarrow 2} \cdots$$

Rotation from body to world

$$R_{0\leftarrow i} = \prod_{j=1}^{i} R_{(j-1)\leftarrow j} = R_{0\leftarrow 1} \cdot R_{1\leftarrow 2} \cdots$$
