

Physically Based Animation

3

- Generate motion of objects using numerical simulation methods

Physically Based Animation

4

Particle Systems

7

- Single particles are very simple
- Large groups can produce interesting effects
- Supplement basic ballistic rules
 - Collisions
 - Interactions
 - Force fields
 - Springs
 - Others...

Feldman, Kingner, O'Brien, SIGGRAPH 2005

7

Basic Particles

8

- Basic governing equation
- \mathbf{f} is a sum of a number of things $\ddot{\mathbf{x}} = \frac{1}{m}\mathbf{f}$
 - Gravity: constant downward force proportional to mass
 - Simple drag: force proportional to negative velocity
 - Particle interactions: particles mutually attract and/or repel
 - Beware $O(n^2)$ complexity!
 - Force fields
 - Wind forces
 - User interaction

8

Integration

13

- For now let's pretend $f = mv$
- Velocity (rather than acceleration) is a function of force

13

Integration

14

- With numerical integration, errors accumulate
- Euler integration is particularly bad

14

Integration

15

• Stability issues can also arise

- Occurs when errors lead to larger errors
- Often more serious than error issues

$$\dot{\mathbf{x}} = [-\sin(\omega t), -\cos(\omega t)]$$

Witkin and Baraff

15

Integration

16

• Modified Euler

$$\mathbf{x}^{t+\Delta t} = \mathbf{x}^t + \frac{\Delta t}{2} (\dot{\mathbf{x}}^t + \dot{\mathbf{x}}^{t+\Delta t})$$

$$\dot{\mathbf{x}}^{t+\Delta t} = \dot{\mathbf{x}}^t + \Delta t \ddot{\mathbf{x}}^t$$

$$\mathbf{x}^{t+\Delta t} = \mathbf{x}^t + \Delta t \dot{\mathbf{x}}^t + \frac{(\Delta t)^2}{2} \ddot{\mathbf{x}}^t$$

16

Integration

17

- Midpoint method

- Compute half Euler step
- Eval. derivative at halfway
- Retake step

- Other methods

- Verlet
- Runge-Kutta
- And *many* others...

Writin and Baraff

17

Integration

18

- Implicit methods

- Informally (incorrectly) called backward methods
- Use derivatives in the future for the current step

$$\mathbf{x}^{t+\Delta t} = \mathbf{x}^t + \Delta t \dot{\mathbf{x}}^{t+\Delta t}$$

$$\dot{\mathbf{x}}^{t+\Delta t} = \dot{\mathbf{x}}^t + \Delta t \ddot{\mathbf{x}}^{t+\Delta t}$$

$$\dot{\mathbf{x}}^{t+\Delta t} = \mathbf{V}(\mathbf{x}^{t+\Delta t}, \dot{\mathbf{x}}^{t+\Delta t}, t + \Delta t)$$

$$\ddot{\mathbf{x}}^{t+\Delta t} = \mathbf{A}(\mathbf{x}^{t+\Delta t}, \dot{\mathbf{x}}^{t+\Delta t}, t + \Delta t)$$

18

Integration

21

- Semi-Implicit
 - Approximate with linearized equations

$$V(\mathbf{x}^{t+\Delta t}, \dot{\mathbf{x}}^{t+\Delta t}) \approx V(\mathbf{x}^t, \dot{\mathbf{x}}^t) + \mathbf{A} \cdot (\Delta \mathbf{x}) + \mathbf{B} \cdot (\Delta \dot{\mathbf{x}})$$

$$A(\mathbf{x}^{t+\Delta t}, \dot{\mathbf{x}}^{t+\Delta t}) \approx A(\mathbf{x}^t, \dot{\mathbf{x}}^t) + \mathbf{C} \cdot (\Delta \mathbf{x}) + \mathbf{D} \cdot (\Delta \dot{\mathbf{x}})$$

$$\begin{bmatrix} \mathbf{x}^{t+\Delta t} \\ \dot{\mathbf{x}}^{t+\Delta t} \end{bmatrix} = \begin{bmatrix} \mathbf{x}^t \\ \dot{\mathbf{x}}^t \end{bmatrix} + \Delta t \left(\begin{bmatrix} \dot{\mathbf{x}}^t \\ \ddot{\mathbf{x}}^t \end{bmatrix} + \begin{bmatrix} \mathbf{A} & \mathbf{B} \\ \mathbf{C} & \mathbf{D} \end{bmatrix} \begin{bmatrix} \Delta \mathbf{x} \\ \Delta \dot{\mathbf{x}} \end{bmatrix} \right)$$

21

Integration

22

- Explicit methods can be conditionally stable
 - Depends on time-step and *stiffness* of system
- Fully implicit can be **un**conditionally stable
 - May still have large errors
- Semi-implicit can be conditionally stable
 - Nonlinearities can cause instability
 - Generally more stable than explicit
 - Comparable errors as explicit
 - Often show up as excessive damping

22

Integration

23

- Integrators can be analyzed in modal domain
- System have different component behaviors
- Integrators impact components differently
