

# Statistical NLP

## Spring 2009

## Lecture 16: Grammar Induction

Dan Klein – UC Berkeley

## Learnability

---

- Learnability: formal conditions under which a formal class of languages can be learned in some sense
- Setup:
  - Class of languages is  $\mathcal{L}$
  - Learner is some algorithm  $H$
  - Learner sees a sequence  $X$  of strings  $x_1 \dots x_n$
  - $H$  maps sequences  $X$  to languages  $L$  in  $\mathcal{L}$
- Question: for what classes do learners exist?

## Learnability: [Gold 67]

---

- Criterion: identification in the limit
  - A **presentation** of  $L$  is an infinite sequence of  $x$  in  $L$  in which each  $x$  occurs at least once
  - A learner  $H$  **identifies  $L$  in the limit** if for any presentation of  $L$ , from some point  $n$  onward,  $H$  always outputs  $L$
  - A class  $\mathcal{L}$  is **identifiable in the limit** if there is some  $H$  which correctly identifies in the limit any  $L$  in  $\mathcal{L}$
- Theorem [Gold 67]: Any  $\mathcal{L}$  which contains all finite languages and at least one infinite language (i.e. is superfinite) is unlearnable in this sense

## Learnability: [Gold 67]

---

- Proof sketch
  - Assume  $\mathcal{L}$  is superfinite
  - There exists a chain  $L_1 \subset L_2 \subset \dots \subset L_\infty$
  - Take any learner  $H$  assumed to identify  $\mathcal{L}$
  - Construct the following misleading sequence
    - Present strings from  $L_1$  until it outputs  $L_1$
    - Present strings from  $L_2$  until it outputs  $L_2$
    - ...
  - This is a presentation of  $L_\infty$ , but  $H$  won't identify  $L_\infty$

## Learnability: [Horning 69]

- Problem: IIL requires that H succeed on each presentation, even the weird ones
- Another criterion: **measure one identification**
  - Assume a distribution  $P_L(x)$  for each L
  - Assume  $P_L(x)$  puts non-zero mass on all and only x in L
  - Assume infinite presentation X drawn i.i.d. from  $P_L(x)$
  - H measure-one identifies L if probability of drawing an X from which H identifies L is 1
- Note: there can be misleading sequences, they just have to be (infinitely) unlikely

## Learnability: [Horning 69]

- Proof sketch
  - Assume  $\mathcal{L}$  is a recursively enumerable set of recursive languages (e.g. the set of PCFGs)
  - Assume an ordering on all strings  $x_1 < x_2 < \dots$
  - Define: two sequences A and B **agree through n** if for all  $x < x_n$ ,  $x$  in A  $\Leftrightarrow$  x in B
  - Define the **error set**  $E(L, n, m)$ :
    - All sequences such that the first m elements do not agree with L through n
    - These are the sequences which contain early strings outside of L (can't happen) or fail to contain all the early strings in L (happens less as m increases)
  - Claim:  $P(E(L, n, m))$  goes to 0 as m goes to  $\infty$
  - Let  $d_L(n)$  be the smallest m such that  $P(E) < 2^{-n}$
  - Let  $d(n)$  be the largest  $d_L(n)$  in first n languages
  - Learner: after  $d(n)$  pick first L that agrees with evidence through n
  - Can only fail for sequence X if X keeps showing up in  $E(L, n, d(n))$ , which happens infinitely often with probability zero (we skipped some details)

## Learnability

- Gold's result says little about real learners (requirements of IIL are way too strong)
- Horning's algorithm is completely impractical (needs astronomical amounts of data)
- Even measure-one identification doesn't say anything about tree structures (or even density over strings)
  - Only talks about learning grammatical sets
  - Strong generative vs weak generative capacity

## Context-Free Grammars

- Looks like a context-free grammar.
- Can model a tree as a collection of context-free rewrites (with probabilities attached).

$$P(\text{NP VERB NP PP} \mid \text{S}) = 0.1$$

## Early Approaches: Structure Search

- Incremental grammar learning, chunking [Wolff 88, Langley 82, many others]
  - Can recover synthetic grammars
- An (extremely good / lucky) result of incremental structure search:

### N-bar or zero determiner NP

zNN → NN | NNS  
 zNN → JJ zNN  
 zNN → zNN zNN

### NP with determiner

zNP → DT zNN  
 zNP → PRP\$ zNN

### Proper NP

zNNP → NNP | NNPS  
 zNNP → zNNP zNNP

### Transitive VPs (complementation)

zVP → zV JJ  
 zVP → zV zNP  
 zVP → zV zNN  
 zVP → zV zPP

### Transitive VPs (adjunction)

zVP → zRB zVP  
 ZVP → zVP zPP

### PP

zPP → zIN zNN  
 zPP → zIN zNP  
 zPP → zIN zNNP

### verb groups / intransitive VPs

zV → VBZ | VBD | VBP  
 zV → MD VB  
 zV → MD RB VB  
 zV → zV zRB  
 zV → zV zVBG

### Intransitive S

zS → PRP zV  
 zS → zNP zV  
 zS → zNNP zV

### Transitive S

zSt → zNNP zVP  
 zSt → zNN zVP  
 zSt → PRP zVP

- Looks good, ... but can't parse in the wild.

## Idea: Learn PCFGs with EM

- Classic experiments on learning PCFGs with Expectation-Maximization [Lari and Young, 1990]

$\{X_1, X_2, \dots, X_n\}$

- Full binary grammar over  $n$  symbols
- Parse uniformly/randomly at first
- Re-estimate rule expectations off of parses
- Repeat

- Their conclusion: it doesn't really work.

## Problem: Model Symmetries

- Symmetries

- How does this relate to trees

## Other Approaches

- Evaluation: fraction of nodes in gold trees correctly posited in proposed trees (unlabeled recall)
- Some recent work in learning constituency:
  - [Adrians, 99] Language grammars aren't general PCFGs
  - [Clark, 01] Mutual-information filters detect constituents, then an MDL-guided search assembles them
  - [van Zaanen, 00] Finds low edit-distance sentence pairs and extracts their differences

## Right-Branching Baseline

---

- English trees tend to be right-branching, not balanced

- A simple (English-specific) baseline is to choose the right chain structure for each sentence

van Zaanen, 00	35.6	
----------------	------	--

## Idea: Distributional Syntax?

---

- Can we use distributional clustering for learning syntax? [Harris, 51]

## Problem: Identifying Constituents

Distributional classes are easy to find...

*the final vote* ✓ ~~*the final*~~ ~~*the initial*~~ ~~*of the*~~ *in the end* ✓ ~~*decided to*~~  
*two decades* ✓ ~~*two of the*~~ ~~*with a*~~ *on time* ✓ ~~*took most of*~~  
*most people* ✓ ~~*without man*~~ *for now* ✓ ~~*go with*~~

... but figuring out which are constituents is hard.

## A Nested Distributional Model

- We'd like a model that:
  - Ties spans to linear contexts (like distributional clustering)
  - Considers only proper tree structures (like a PCFG model)
  - Has no symmetries to break (like a dependency model)

## Constituent-Context Model (CCM)

$$P(S|T) =$$

$$\prod_{(i,j) \in T} \left[ \frac{P(\phi_{ij} | +) P(\chi_{ij} | +)}{P(\diamond \_ \diamond | +)} \right]$$

$$\prod_{(i,j) \notin T} \left[ \frac{P(\phi_{ij} | -) P(\chi_{ij} | -)}{P(\diamond \_ \text{fell} | +)} \right]$$

## Results: Constituency

Right-Branch	70.0	<div style="width: 100%; height: 10px; background-color: black;"></div>
--------------	------	-------------------------------------------------------------------------

## Spectrum of Systematic Errors

CCM  
analysis  
better

Treebank  
analysis  
better

Analysis	Inside NPs	Possesives	Verb groups
CCM	<i>the [lazy cat]</i>	<i>John ['s cat]</i>	<i>[will be] there</i>
Treebank	<i>the lazy cat</i>	<i>[John 's] cat</i>	<i>will [be there]</i>
CCM Right?	Yes	Maybe	No

*But the worst errors are the non-systematic ones (~25%)*

## Syntactic Parsing

- Parsing assigns structures to sentences.

- Dependency structure gives attachments.

## Idea: Lexical Affinity Models

- Words select other words on syntactic grounds

- Link up pairs with high mutual information
  - [Yuret, 1998]: Greedy linkage
  - [Paskin, 2001]: Iterative re-estimation with EM
- Evaluation: compare linked pairs to a gold standard

Method	Accuracy
Paskin, 2001	39.7 <span style="background-color: green; color: black;">██████████</span>

## Problem: Non-Syntactic Affinity

- Mutual information between words does not necessarily indicate syntactic selection.

*congress narrowly passed the amended bill*

*expect brushbacks but no beanballs*

*a new year begins in new york*

## Idea: Word Classes

- Individual words like *congress* are entwined with semantic facts about the world.
- Syntactic classes, like **NOUN** and **ADVERB** are bleached of word-specific semantics.
- Automatic word classes more likely to look like **DAYS-OF-WEEK** or **PERSON-NAME**.
- We could build dependency models over word classes. [cf. Carroll and Charniak, 1992]

## Problems: Word Class Models

Random	41.7	██████████
Carroll and Charniak, 92	44.7	██████████

- Issues:
  - Too simple a model – doesn't work much better supervised
  - No representation of valence (number of arguments)

## Local Representations

	Classes?	Distance	Local Factor
Paskin 01	✗	✗	$P(a   h)$

## A Head-Outward Model (DMV)

- Supervised statistical parsers benefit from modeling tree distributions implicitly. [e.g., Collins, 99]
- A head-outward model with word classes and valence/adjacency:

$$P(t_h) = \prod_{dir \in \{l, r\}}$$

## Common Errors: Dependency

Overproposed  
Dependencies

Underproposed  
Dependencies

DET ← N	3474	→	DET → N	3079
N-PROP ← N-PROP	2096	→	N-PROP → N-PROP	1898
NUM → NUM	760	→	PREP ← N	838
PREP ← DET	735	→	N → V-PRES	714
DET ← N-PL	696	→	DET → N-PL	672
DET → PREP	627	→	N ← PREP	669
DET → V-PAST	470	→	NUM ← NUM	54
DET → V-PRES	420	→	N → V-PAST	54

## Results: Dependencies

Adjacent Words	55.9	
DMV	62.7	

- Situation so far:
  - Task: unstructured text in, word pairs out
  - Previous results were below baseline
  - We modeled word classes [cf. Carroll & Charniak 92]
  - We added a model of distance [cf. Collins 99]
  - Resulting model is substantially over baseline
  - ... but we can do much better

## Results: Combined Models

### Dependency Evaluation (Undir. Dep. Acc.)

Random	45.6	
DMV	62.7	
CCM + DMV	64.7	

### Constituency Evaluation (Unlabeled Recall)

Random	39.4	
CCM	81.0	
CCM + DMV	88.0	

- Supervised PCFG constituency recall is at 92.8
- Qualitative improvements
  - Subject-verb groups gone, modifier placement improved

## How General is This?

### Constituency Evaluation

English (7422 sentences)		
Random Baseline	39.4	
CCM+DMV	88.0	
German (2175 sentences)		
Random Baseline	49.6	
CCM+DMV	89.7	
Chinese (2473 sentences)		
Random Baseline	35.5	
CCM+DMV	46.7	
DMV	54.2	
CCM+DMV	60.0	

### Dependency Evaluation

## Apartment hunting

### \$1925 / 4br - Union City- 4br/2ba 2-story house w/Recent Upgrades, Gardener Included

(fremont / union city)

Reply to: [anon-87179918@craigslist.org](mailto:anon-87179918@craigslist.org)  
Date: 2005-07-26, 10:00PM PDT

Spacious, light and airy four-bedroom, two-bath house located in cul-de-sac. Perfect for entertaining guests!! Great, friendly neighbors and minutes from Union City BART, shopping centers, 880, 84, and Quarry Lakes Regional Park. Located in Union City, the lot size is approximately 5200 sq. ft with approximately 1500 sq ft of living space. Come take a look at your new home!

Amenities include:  
Central Heating, no A/C

Large, professionally maintained yard w/fruitbearing trees

Two car garage (new garage door and opener)

Living room with wood burning fireplace

Dining room - great view of the backyard

- Craigslist.org classified ads
- Would like search on attributes
- Can't, because listings are largely unstructured
- Need to structure them automatically

■ Size ■ Contact ■ Terms ■ Location ■ Features

Duplex - Newly remodeled 2 Bdrms/1 Bath, spacious upper unit, located in Hilltop Mall area. Walking distance to shopping, public transportation, schools and park. Paid water and garbage, carport and plenty of street parking. Washer and dryer are provided. Private patio yard, view. Contact number (510) 691-9419, (510) 464-6581, (510) 724-6988.

Spacious 2 bd/1 ba top floor unit available now in Kentfield. Complex is located within walking distance of many small shops and businesses. Tenants are entitled to parking, use of laundry facilities, and access to the roof top patio. This unit is available now on a 1-year lease. Monthly rent is \$1147, with a security deposit of \$1000.00. Cats and non-barking dogs are welcome with an additional deposit. Please call us at 456-4044.

182 Echo AVE#1, Great Campbell location, front unit 3 bedrooms, 2 full baths with new carpet and paint, patio, POOL, one car carport, laundry in the building, water and garbage included, available now, deposit is also \$1395, contact TALI (408) 489-7149, 182 Echo Ave #1

## Types of IE problems

### “Nugget” Extraction

- Document is mostly background text
- Information “nuggets” are defined extrinsically by the task

### Field Segmentation

- Document consists entirely of a sequence of fields
  - Fields are a salient and intrinsic form of structure
- ➔ Seems suitable for unsupervised learning!

## Related IE Work

- Supervised field segmentation
  - McCallum et al. (1999) - HMMs for parsing citations
  - McCallum et al. (2000) - MEMMs for parsing FAQs
  - Peng and McCallum (2004) - CRFs for parsing paper headers
- Unsupervised field segmentation
  - Hearst (1997) - “TextTiling”
  - Blei and Moreno (2001) - “Aspect HMM”
  - Pasula et al. (2002) - Unsupervised citation parsing as part of a large model of “identity uncertainty”
  - Barzilay and Lee (2004) - “Content models”

# Data and Evaluation

## Classified Ads

- Novel corpus
- 8767 unique rental listings collected from craigslist.org in June 2004
- 302 listings are annotated with 12 fields, including *size*, *rent*, *contact*, etc.
- Average listing has 119 tokens in 9 fields

## Bibliographic Citations

- Described in McCallum et al. (1999)
- 500 citations collected from 500 academic papers
- All are annotated with 13 fields, including *author*, *title*, *journal*, etc.
- Average citation has 35 tokens in 6 fields

# Segment and cluster

- Crude segmentation & EM clustering improve upon baseline
- We can do better: simultaneous segmentation and clustering!

# Hidden Markov Models

$$P(\mathbf{s}, \mathbf{w}) = \prod_i P(s_i | s_{i-1}) P(w_i | s_i)$$

# Unsupervised learning

- Standard unsupervised learning in HMMs:
  - EM, with Baum-Welch for computing E-step
  - Fixed number of states (equal to number of fields)
  - Uniform initialization of transition model
  - Near-uniform initialization of emission model
- Performs terribly:

# What went wrong?

# What's being learned?

# What's being learned?

# Diagonal Transition Structure

$$P(s_i | s_{i-1}) = \begin{cases} \sigma + \frac{(1-\sigma)}{|S|} & \text{if } s_i = s_{i-1} \\ \frac{(1-\sigma)}{|S|} & \text{otherwise} \end{cases}$$

# What's still wrong?

## Boundary model

- In data, boundaries are salient, but no representation of boundaries in our model
- Add a boundary state, which emits boundary tokens
- Modify fixed transition function so that fields prefer to end with boundary state
- Boosts accuracy:
