Lecture 12: Phrase Alignment

Dan Klein – UC Berkeley

Phrase Movement

Phrase Movement

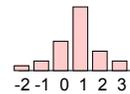

The HMM Model

- Model 2 preferred global monotonicity
- We want local monotonicity:
 - Most jumps are small
- HMM model (Vogel 96)

f	$i(f e)$
nationale	0.469
national	0.418
nationaux	0.054
nationales	0.029

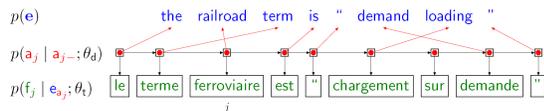

$$P(f, a|e) = \prod_j P(a_j|a_{j-1})P(f_j|e_i)$$

$$P(a_j - a_{j-1})$$

- Re-estimate using the forward-backward algorithm
- Handling nulls requires some care
- What are we still missing?

The HMM Model

Distortion θ_d

$$p(\dots) = 0.6$$

$$p(\dots) = 0.2$$

$$p(\dots) = 0.1$$

Translation θ_t

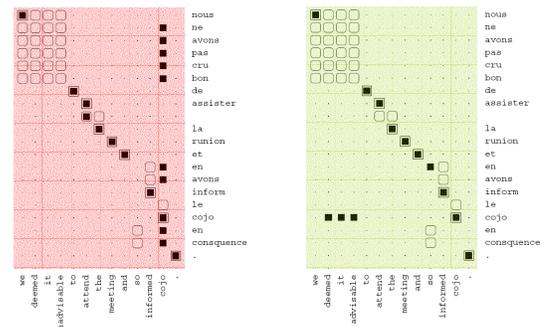

$$p(\text{the} \rightarrow \text{le}) = 0.53$$

$$p(\text{the} \rightarrow \text{la}) = 0.24$$

$$p(\text{railroad} \rightarrow \text{ferroviaire}) = 0.19$$

$$p(\text{NULL} \rightarrow \text{le}) = 0.12$$

Feature-Based Alignment

Finding Viterbi Alignments

[Lacoste-Julien, Taskar, Jordan, and Klein, 05]

Learning w

- Supervised training data

(x^i, y^i)

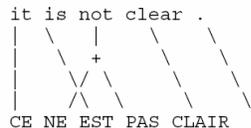

- Training methods
 - Maximum likelihood/entropy
 - Perceptron
 - Maximum margin

[Lacoste-Julien, Taskar, Jordan, and Klein, 05]

Decoding

- In these word-to-word models
 - Finding best alignments is easy
 - Finding translations is hard (why?)

Exact reconstruction (24 of 38)

Please give me your response as soon as possible.
 \Rightarrow Please give me your response as soon as possible.

Reconstruction preserving meaning (8 of 38)

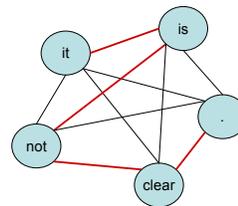

Now let me mention some of the disadvantages.
 \Rightarrow Let me mention some of the disadvantages now.

Garbage reconstruction (6 of 38)

In our organization research has two missions.
 \Rightarrow In our missions research organization has two.

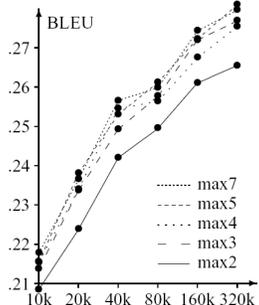

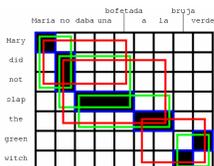

Bag Generation as a TSP

- Imagine bag generation with a bigram LM
 - Words are nodes
 - Edge weights are $P(w|w')$
 - Valid sentences are Hamiltonian paths
- Not the best news for word-based MT!

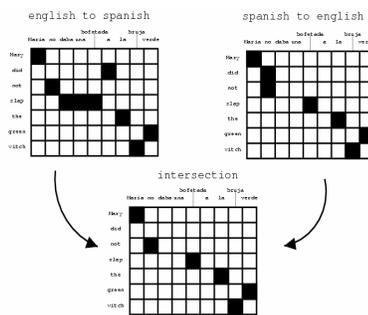

Phrase Size

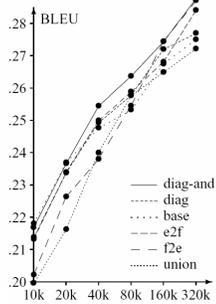

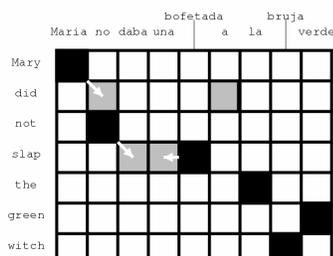

- Phrases do help
 - But they don't need to be long
 - Why should this be?

Lexical Weighting

$$\phi(\bar{f}_i | \bar{e}_i) = \frac{\text{count}(\bar{f}_i, \bar{e}_i)}{\text{count}(\bar{e}_i)} p_w(\bar{f}_i | \bar{e}_i)$$

$f_1 \ f_2 \ f_3$
 NULL -- -- ##
 e1 ## -- --
 e2 -- ## --
 e3 -- ## --

$$\begin{aligned}
 p_w(\bar{f} | \bar{e}, a) &= p_w(f_1 f_2 f_3 | e_1 e_2 e_3, a) \\
 &= w(f_1 | e_1) \\
 &\quad \times \frac{1}{2} (w(f_2 | e_2) + w(f_2 | e_3)) \\
 &\quad \times w(f_3 | \text{NULL})
 \end{aligned}$$

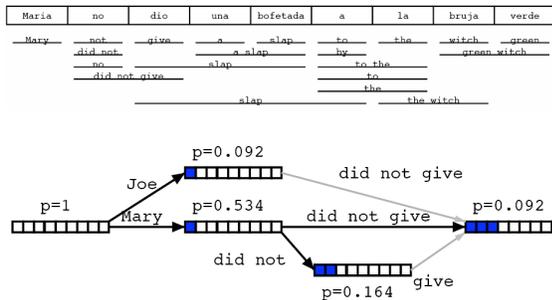

The Pharaoh Decoder

- Probabilities at each step include LM and TM

Hypothesis Lattices

Pruning

Maria no dio una bofetada a la bruja verde

e: Mary did not
f: **-----

easier part
--> lower cost

- Problem: easy partial analyses are cheaper
 - Solution 1: use beams per foreign subset
 - Solution 2: estimate forward costs (A*-like)

WSD?

- Remember when we discussed WSD?
 - Word-based MT systems rarely have a WSD step
 - Why not?
