

Statistical NLP Spring 2007

Lecture 7: Word Classes

Dan Klein – UC Berkeley

What's Next for POS Tagging

- Better features!

PRP VBD IN RB IN PRP VBD .
They left as soon as he arrived .

- We could fix this with a feature that looked at the next word

JJ
NNP NNS VBD VBN .
Intrinsic flaws remained undetected .

- We could fix this by linking capitalized words to their lowercase versions

- Solution: maximum entropy sequence models

- Reality check:
 - Taggers are already pretty good on WSJ journal text...
 - What the world needs is taggers that work on other text!
 - Also: same techniques used for other sequence models (NER, etc)

Common Errors

- Common errors [from Toutanova & Manning 00]

	JJ	NN	NNP	NNPS	RB	RP	IN	VB	VBD	VBN	VBP	Total
JJ	0	177	56	0	61	2	5	10	15	108	0	488

Sequence-Free Tagging?

- What about looking at a word and its environment, but no sequence information?

- Add in previous / next word the __
- Previous / next word shapes X __ X
- Occurrence pattern features [X: x X occurs]
- Crude entity detection __ (Inc.|Co.)
- Phrasal verb in sentence? put __
- Conjunctions of these things

- All features except sequence: 96.6% / 86.8%
- Uses lots of features: > 200K
- Why isn't this the standard approach?

Maxent Taggers

- One step up: also condition on previous tags

$$P(t|w) = \prod_i P_{ME}(t_i|w, t_{i-1}, t_{i-2}, i)$$

- Train up $P(t_i|w, t_{i-1}, t_{i-2}, i)$ as a normal maxent problem, then use to score sequences
- This is referred to as a *maxent tagger* [Ratnaparkhi 96]
- Beam search effective! (Why?)
- What's the advantage of beam size 1?

Feature Templates

- Important distinction:
 - Features: $\langle w_0 = \text{future}, t_0 = \text{JJ} \rangle$
 - Feature templates: $\langle w_0, t_0 \rangle$
- In maxent taggers:
 - Can now add *edge* feature templates:
 - $\langle t_1, t_0 \rangle$
 - $\langle t_2, t_1, t_0 \rangle$
 - Also, mixed feature templates:
 - $\langle t_1, w_0, t_0 \rangle$

Decoding

- Decoding maxent taggers:
 - Just like decoding HMMs
 - Viterbi, beam search, posterior decoding
- Viterbi algorithm (HMMs):

$$\delta_i(s) = \arg \max_{s'} P(s|s')P(w_i|s)\delta_{i-1}(s')$$

- Viterbi algorithm (Maxent):

$$\delta_i(s) = \arg \max_{s'} P(s|s', w, i)\delta_{i-1}(s')$$

TBL Tagger

- [Brill 95] presents a *transformation-based tagger*
 - Label the training set with most frequent tags
 - DT MD VBD VBD .
 - The can was rusted .
 - Add transformation rules which reduce training mistakes
 - MD → NN : DT ____
 - VBD → VBN : VBD ____
 - Stop when no transformations do sufficient good
 - Does this remind anyone of anything?
- Probably the most widely used tagger (esp. outside NLP)
- ... but not the most accurate: 96.6% / 82.0 %

TBL Tagger II

- What gets learned? [from Brill 95]

#	Change Tag	Condition
1	NN VB	Previous tag is TO
2	VBP VB	One of the previous three tags is MD
3	NN VB	One of the previous two tags is MD
4	VB NN	One of the previous two tags is DT
5	VBD VBN	One of the previous three tags is VBZ
6	VBN VBD	Previous tag is PRP
7	VBN VBD	Previous tag is VBP
8	VBD VBN	Previous tag is VBD
9	VBP VB	Previous tag is TO
10	POS VBZ	Previous tag is PRP
11	VB VBP	Previous tag is VNS
12	VBD VBN	One of previous three tags in VBP
13	IN WDT	One of next two tags in VB
14	VBD VBN	One of previous two tags in VB
15	VB VBP	Previous tag in PRP
16	IN WDT	Next tag in VBZ
17	IN DT	Next tag in NN
18	JJ NFP	Next tag in VBP
19	IN WDT	Next tag in VBD
20	JJR RBR	Next tag in JJ

#	Change Tag	Condition
1	NN SNS	Has suffix -s
2	NN CD	Has character .
3	NN JJ	Has character -
4	NN VBN	Has suffix -ed
5	NN VBG	Has suffix -ing
6	?? RB	Has suffix -ly
7	?? JJ	Adding suffix -ly results in a word.
8	NN CD	The word \$ can appear to the left.
9	NN JJ	Has suffix -al
10	NN VB	The word would can appear to the left.
11	NN CD	Has character @
12	NN JJ	The word be can appear to the left.
13	NNS JJ	Has suffix -ous
14	NNS VBZ	The word it can appear to the left.
15	NN JJ	Has suffix -ible
16	NN JJ	Has suffix -ic
17	NN CD	Has character I
18	NNS NN	Has suffix -ss
19	?? JJ	Deleting the prefix sum- results in a word
20	NN JJ	Has suffix -ive

EngCG Tagger

- English constraint grammar tagger
 - [Tapanainen and Voutilainen 94]
 - Something else you should know about
 - Hand-written and knowledge driven
 - "Don't guess if you know" (general point about modeling more structure!)
 - Tag set doesn't make all of the hard distinctions as the standard tag set (e.g. JJ/NN)
 - They get stellar accuracies: 98.5% on *their* tag set
 - Linguistic representation matters...
 - ... but it's easier to win when you make up the rules

CRF Taggers

- Newer, higher-powered discriminative sequence models
 - CRFs (also voted perceptrons, M3Ns)
 - Do not decompose training into independent local regions
 - Can be deathly slow to train – require repeated inference on training set
- Differences tend not to be too important for POS tagging
- Differences more substantial on other sequence tasks
- However: one issue worth knowing about in local models
 - "Label bias" and other explaining away effects
 - Maxent taggers' local scores can be near one without having both good "transitions" and "emissions"
 - This means that often evidence doesn't flow properly
 - Why isn't this a big deal for POS tagging?

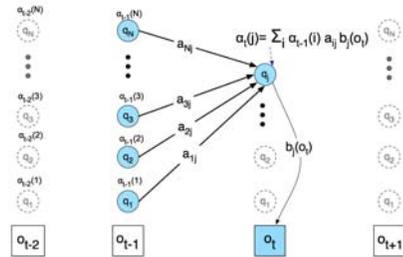

Domain Effects

- Accuracies degrade outside of domain
 - Up to triple error rate
 - Usually make the most errors on the things you care about in the domain (e.g. protein names)
- Open questions
 - How to effectively exploit unlabeled data from a new domain (what could we gain?)
 - How to best incorporate domain lexica in a principled way (e.g. UMLS specialist lexicon, ontologies)

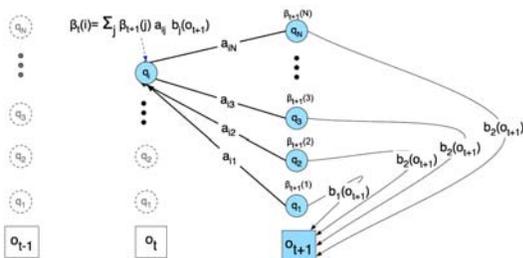

Unsupervised Tagging?

- AKA part-of-speech induction
- Task:
 - Raw sentences in
 - Tagged sentences out
- Obvious thing to do:
 - Start with a (mostly) uniform HMM
 - Run EM
 - Inspect results

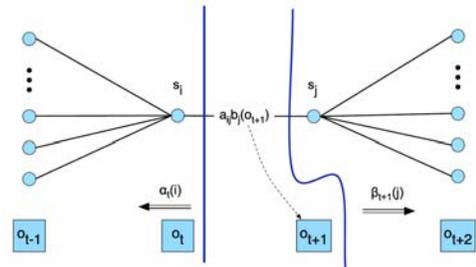

Forward Recurrence

Backward Recurrence

Fractional Transitions

EM for HMMs: Quantities

- Cache total path values:

$$\begin{aligned} \alpha_i(s) &= P(w_0 \dots w_i, s_i) \\ &= \sum_{s_{i-1}} P(s_i | s_{i-1}) P(w_i | s_i) \alpha_{i-1}(s_{i-1}) \end{aligned}$$

$$\begin{aligned} \beta_i(s) &= P(w_{i+1} \dots w_n | s_i) \\ &= \sum_{s_{i+1}} P(s_{i+1} | s_i) P(w_{i+1} | s_{i+1}) \beta_{i+1}(s_{i+1}) \end{aligned}$$

- Can calculate in $O(s^2n)$ time (why?)

EM for HMMs: Process

- From these quantities, we can re-estimate transitions:

$$\text{count}(s \rightarrow s') = \frac{\sum_i \alpha_i(s) P(s' | s) P(w_i | s) \beta_{i+1}(s')}{P(\mathbf{w})}$$

- And emissions:

$$\text{count}(w, s) = \frac{\sum_{i: w_i = w} \alpha_i(s) \beta_{i+1}(s)}{P(\mathbf{w})}$$

- If you don't get these formulas immediately, just think about hard EM instead, where we re-estimate from the Viterbi sequences

Merialdo: Setup

- Some (discouraging) experiments [Merialdo 94]
- Setup:
 - You know the set of allowable tags for each word
 - Fix k training examples to their true labels
 - Learn $P(w|t)$ on these examples
 - Learn $P(t_i, t_j)$ on these examples
 - On n examples, re-estimate with EM
- Note: we know allowed tags but not frequencies

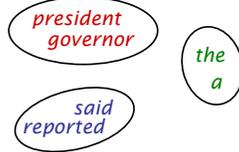

Merialdo: Results

Number of tagged sentences used for the initial model							
	0	100	2000	5000	10000	20000	all
Iter	Correct tags (% words) after ML on 1M words						
0	77.0	90.0	95.4	96.2	96.6	96.9	97.0
1	80.5	92.6	95.8	96.3	96.6	96.7	96.8
2	81.8	93.0	95.7	96.1	96.3	96.4	96.4
3	83.0	93.1	95.4	95.8	96.1	96.2	96.2
4	84.0	93.0	95.2	95.5	95.8	96.0	96.0
5	84.8	92.9	95.1	95.4	95.6	95.8	95.8
6	85.3	92.8	94.9	95.2	95.5	95.6	95.7
7	85.8	92.8	94.7	95.1	95.3	95.5	95.5
8	86.1	92.7	94.6	95.0	95.2	95.4	95.4
9	86.3	92.6	94.5	94.9	95.1	95.3	95.3
10	86.6	92.6	94.4	94.8	95.0	95.2	95.2

Distributional Clustering

◆ *the president said that the downturn was over* ◆

president	the __ of
president	the __ said
governor	the __ of
governor	the __ appointed
said	sources __ ◆
said	president __ that
reported	sources __ ◆

[Finch and Chater 92, Shuetze 93, many others]

Distributional Clustering

- Three main variants on the same idea:
 - Pairwise similarities and heuristic clustering
 - E.g. [Finch and Chater 92]
 - Produces dendrograms
 - Vector space methods
 - E.g. [Shuetze 93]
 - Models of ambiguity
 - Probabilistic methods
 - Various formulations, e.g. [Lee and Pereira 99]
