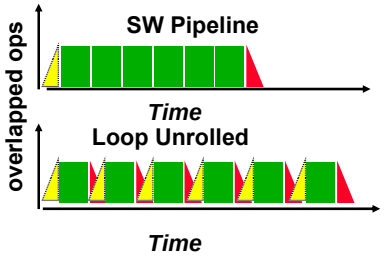
Recall: Software Pipelining Example

Before: Unrolled 3 times

```
1  LD    F0,0(R1)
2  ADDD  F4,F0,F2
3  SD    0(R1),F4
4  LD    F6,-8(R1)
5  ADDD  F8,F6,F2
6  SD    -8(R1),F8
7  LD    F10,-16(R1)
8  ADDD  F12,F10,F2
9  SD    -16(R1),F12
10 SUBI  R1,R1,#24
11 BNEZ  R1,LOOP
```

After: Software Pipelined

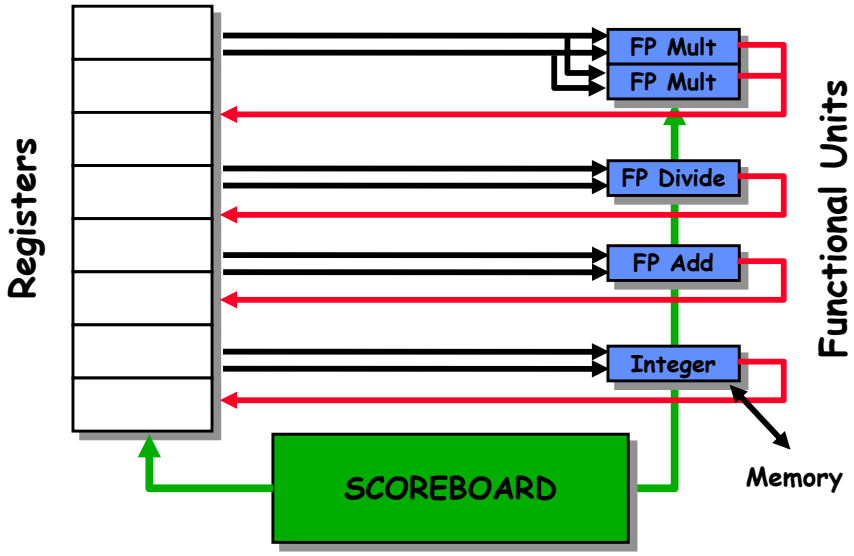
```
1  SD    0(R1),F4 ; Stores M[i]
2  ADDD  F4,F0,F2 ; Adds to M[i-1]
3  LD    F0,-16(R1);Loads M[i-2]
4  SUBI  R1,R1,#8
5  BNEZ  R1,LOOP
```



- Symbolic Loop Unrolling
  - Maximize result-use distance
  - Less code space than unrolling
  - Fill & drain pipe only once per loop
    vs. once per each unrolled iteration in loop unrolling

5 cycles per iteration

Review: Scoreboard (CDC 6600)



Review: Scoreboard Implications

- Scoreboard keeps track of dependencies between instructions that have already issued.
  - Scoreboard replaces ID, EX, WB with 4 stages
- Out-of-order completion => WAR, WAW hazards?
- Solutions for WAR:
  - Stall writeback until registers have been read
  - Read registers only during Read Operands stage
  - *Greatly limits overlap of independent computations*
- Solution for WAW:
  - Detect hazard and stall issue of new instruction until other instruction completes
  - *Prevents overlapping of loop iterations!*
- No register renaming!
  - We will fix this today
- Need to have multiple instructions in execution phase => multiple execution units or pipelined execution units

Review: Scoreboard Example: Cycle 62

Instruction status:

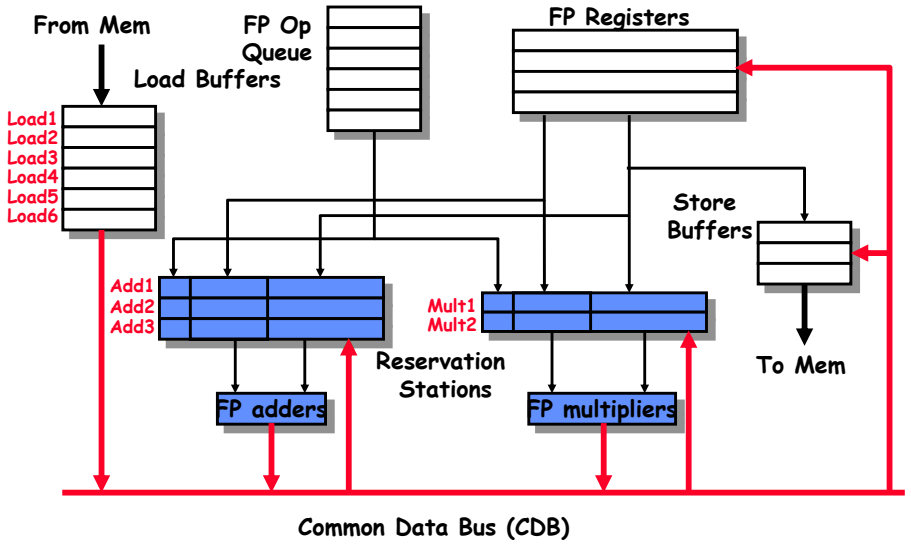
62	FU									

- In-order issue; out-of-order execute & commit

Another Dynamic Algorithm: Tomasulo Algorithm

- For IBM 360/91 about 3 years after CDC 6600 (1966)
- Goal: High Performance without special compilers
- Differences between IBM 360 & CDC 6600 ISA
  - IBM has only 2 register specifiers/instr vs. 3 in CDC 6600
  - IBM has 4 FP registers vs. 8 in CDC 6600
  - IBM has memory-register ops
- Why Study? lead to Alpha 21264, HP 8000, MIPS 10000, Pentium II, PowerPC 604, …

Tomasulo Organization



Tomasulo Algorithm vs. Scoreboard

- Control & buffers distributed with Function Units (FU) vs. centralized in scoreboard;
  - FU buffers called "reservation stations"; have pending operands
- Registers in instructions replaced by values or pointers to reservation stations(RS); called register renaming ;
  - avoids WAR, WAW hazards
  - More reservation stations than registers, so can do optimizations compilers can't
- Results to FU from RS, not through registers, over Common Data Bus that broadcasts results to all FUs
- Load and Stores treated as FUs with RSs as well
- Integer instructions can go past branches, allowing FP ops beyond basic block in FP queue

Reservation Station Components

Op: Operation to perform in the unit (e.g., + or –)

Vj, Vk: Value of Source operands

- Store buffers has V field, result to be stored

Qj, Qk: Reservation stations producing source registers (value to be written)

- Note: No ready flags as in Scoreboard; Qj,Qk=0 => ready
- Store buffers only have Qi for RS producing result

Busy: Indicates reservation station or FU is busy

Register result status—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions that will write that register.

Three Stages of Tomasulo Algorithm

1. **Issue**—get instruction from FP Op Queue
   If reservation station free (no structural hazard), control issues instr & sends operands (renames registers).
2. **Execution**—operate on operands (EX)
   When both operands ready then execute; if not ready, watch Common Data Bus for result
3. **Write result**—finish execution (WB)
   Write on Common Data Bus to all awaiting units; mark reservation station available

- Normal data bus: data + destination ("go to" bus)
- Common data bus: data + source ("come from" bus)
  - 64 bits of data + 4 bits of Functional Unit source address
  - Write if matches expected Functional Unit (produces result)
  - Does the broadcast

CS 252 Administrivia

- Interesting new Resource: http://bitsavers.org
  - Has digital versions of users manuals for old machines
  - Quite interesting!
  - I'll link in some of them to your reading pages when it is appropriate
  - Very limited bandwidth: use mirrors such as: http://bitsavers.vt100.net
- Textbook Reading for next few lectures:
  - Computer Architecture: A Quantitative Approach, Chapter 2
- Exams:
  - Wednesday March 18th and Wednesday May 6th
  - Currently 6:00 – 9:00pm. It would be here in 310 Soda
  - Still have pizza afterwards…

Paper Discussion (Reading #4)

- "The CRAY-1 Computer System," Richard Russel. *Communications of the ACM*, 21(1) 63-72, January 1978
  - Very successful Vector Machine
  - Highly tuned physical implementation
  - No Virtual Memory: segmented protection + relocatable code
- "Parallel Operation in the CDC 6600," James E. Thorton. *AFIPS Proc*. FJCC, pt. 2 vol. 03, pp. 33-40, 1964
  - Pushed the Load-Store architecture that became staple of RISC
  - Scoreboard for OOO execution (last lecture)
  - Separation of I/O processors from main processor
    - » Memory-mapped communication between them
    - » Very modern ideas

Tomasulo Loop Example

```
Loop: LD     F0   0   R1
      MULTD  F4   F0  F2
      SD     F4   0   R1
      SUBI   R1   R1  #8
      BNEZ   R1   Loop
```

- Assume Multiply takes 4 clocks
- Assume first load takes 8 clocks (cache miss), second load takes 1 clock (hit)
- To be clear, will show clocks for SUBI, BNEZ
- Reality: integer instructions ahead

Why can Tomasulo overlap iterations of loops?

- **Register renaming**
  - Multiple iterations use different physical destinations for registers (dynamic loop unrolling).
- **Reservation stations**
  - Permit instruction issue to advance past integer control flow operations
- **Other idea: Tomasulo building dynamic "DataFlow" graph from instructions**
  - Fits in with readings for Wednesday

Explicit Register Renaming

- **Tomasulo provides *Implicit Register Renaming***
  - User registers renamed to reservation station tags
- **Explicit Register Renaming:**
  - Use *physical* register file that is larger than number of registers specified by ISA
- **Keep a translation table:**
  - ISA register => physical register mapping
  - When register is written, replace table entry with new register from freelist.
  - Physical register becomes free when not being used by any instructions in progress.
- **Pipeline can be exactly like "standard" DLX pipeline**
  - IF, ID, EX, etc….
- **Advantages:**
  - Removes all WAR and WAW hazards
  - Like Tomasulo, good for allowing full out-of-order completion
  - Allows data to be fetched from a single register file
  - Makes speculative execution/precise interrupts easier:
    - » All that needs to be "undone" for precise break point is to undo the table mappings

Question: Can we use explicit register renaming with scoreboard?

Explicit Renaming Support Includes:

- **Rapid access to a table of translations**
- **A physical register file that has more registers than specified by the ISA**
- **Ability to figure out which physical registers are free.**
  - **No free registers ⇒ stall on issue**
- **Thus, register renaming doesn't require reservation stations. However:**
  - **Many modern architectures use explicit register renaming + Tomasulo-like reservation stations to control execution.**

Summary

- Reservations stations: *renaming* to larger set of registers + buffering source operands
  - Prevents registers as bottleneck
  - Avoids WAR, WAW hazards of Scoreboard
  - Allows loop unrolling in HW
- Dynamic hardware schemes can unroll loops dynamically in hardware
  - Form of limited dataflow
  - Register renaming is essential
- Helps cache misses as well
- Lasting Contributions of Tomasulo Algorithm
  - Dynamic scheduling
  - Register renaming
  - Load/store disambiguation
- 360/91 descendants are Pentium II; PowerPC 604; MIPS R10000; HP-PA 8000; Alpha 21264

Summary #2

- Explicit Renaming: more physical registers than needed by ISA.
  - Rename table: tracks current association between architectural registers and physical registers
  - Uses a translation table to perform compiler-like transformation on the fly
- With Explicit Renaming:
  - All registers concentrated in single register file
  - Can utilize bypass network that looks more like 5-stage pipeline
  - Introduces a register-allocation problem
    - » Need to handle branch misprediction and precise exceptions differently, but ultimately makes things simpler
- For precise exceptions and branch prediction:
  - Clearly need something like reorder buffer/future file (next time)
