# EECS 262a Advanced Topics in Computer Systems Lecture 20

#### VM Migration/VM Cloning April 6<sup>th</sup>, 2016

John Kubiatowicz Electrical Engineering and Computer Sciences University of California, Berkeley

http://www.eecs.berkeley.edu/~kubitron/cs262

#### **Today's Papers**

- <u>Live Migration of Virtual Machines</u>
   C. Clark, K. Fraser, S. Hand, J. Hansen, E. Jul, C. Limpach, I. Pratt, A. Warfield. Appears in *Proceedings of the 2nd Symposium on Networked Systems Design and Implementation* (NSDI), 2005
- SnowFlock: Rapid Virtual Machine Cloning for Cloud Computing
  H. Andrés Lagar-Cavilla, Joseph A. Whitney, Adin Scannell, Philip Patchin,
  Stephen M. Rumble, Eyal de Lara, Michael Brudno, and M. Satyanarayana.
  Appears in Proceedings of the European Professional Society on Computer
  Systems Conference (EuroSys), 2009
- Today: explore value of leveraging the VMM interface for new properties (migration and cloning), many others as well including debugging and reliability
- · Thoughts?

4/6/2016 Cs262a-S16 Lecture-20 2

#### Why Migration is Useful

- · Load balancing for long-lived jobs (why not short lived?)
- Ease of management: controlled maintenance windows
- Fault tolerance: move job away from flaky (but not yet broken hardware)
- Energy efficiency: rearrange loads to reduce A/C needs
- Data center is the right target

# **Benefits of Migrating Virtual Machines Instead of Processes**

- Avoids `residual dependencies'
- Can transfer in-memory state information
- Allows separation of concern between users and operator of a datacenter or cluster

4/6/2016 Cs262a-S16 Lecture-20 3 4/6/2016 Cs262a-S16 Lecture-20 4

#### **Background – Process-based Migration**

- Typically move the process and leave some support for it back on the original machine
  - E.g., old host handles local disk access, forwards network traffic
  - these are "residual dependencies" old host must remain up and in use
- Hard to move exactly the right data for a process which bits of the OS must move?
  - E.g., hard to move TCP state of an active connection for a process

4/6/2016 Cs262a-S16 Lecture-20 6 4/6/2016

#### Goals / Challenges

- · Minimize downtime (maximize availability)
- · Keep the total migration time manageable
- Avoid disrupting active services by limiting impact of migration on both migratee and local network

#### **VMM Migration**

- Move the whole OS as a unit don't need to understand the OS or its state
- Can move apps for which you have no source code (and are not trusted by the owner)
- Can avoid residual dependencies in data center thanks to global names
- · Non-live VMM migration is also useful:
  - Migrate your work environment home and back: put the suspended VMM on a USB key or send it over the network

Cs262a-S16 Lecture-20

- Collective project, "Internet suspend and resume"

### **VM Memory Migration Options**

- Push phase
- · Stop-and-copy phase
- Pull phase
  - Not in Xen VM migration paper, but in SnowFlock

4/6/2016 Cs262a-S16 Lecture-20 8 4/6/2016 Cs262a-S16 Lecture-20

#### **Implementation**

- · Pre-copy migration
  - Bounded iterative push phase
    - » Rounds
    - » Writable Working Set
  - Short stop-and-copy phase
- Be careful to avoid service degradation

4/6/2016 Cs262a-S16 Lecture-20 10

#### **Live Migration Approach (II)**

- Update IP address to MAC address translation using "gratuitous ARP" packet
  - Service packets starting coming to the new host
  - May lose some packets, but this could have happened anyway and TCP will recover
- Restart service on the new host
- Delete domain from the source host (no residual dependencies)

#### **Live Migration Approach (I)**

- Allocate resources at the destination (to ensure it can receive the domain)
- Iteratively copy memory pages to the destination host
  - Service continues to run at this time on the source host
  - Any page that gets written will have to be moved again
  - Iterate until a) only small amount remains, or b) not making much forward progress
  - Can increase bandwidth used for later iterations to reduce the time during which pages are dirtied
- Stop and copy the remaining (dirty) state
  - Service is down during this interval
  - At end of the copy, the source and destination domains are identical and either one could be restarted
  - Once copy is acknowledged, the migration is committed in the transactional

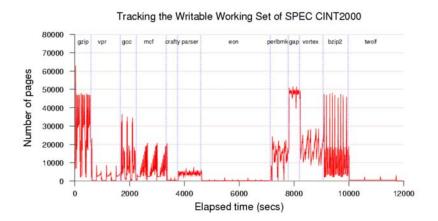

4/6/2016 Cs262a-S16 Lecture-20 11

#### **Tracking the Writable Working Set**

- Xen inserts shadow pages under the guest OS, populated using guest OS's page tables
- The shadow pages are marked read-only
- If OS tries to write to a page, the resulting page fault is trapped by Xen
- Xen checks the OS's original page table and forwards the appropriate write permission
- If the page is not read-only in the OS's PTE, Xen marks the page as dirty

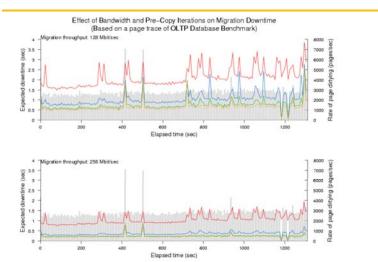

4/6/2016 Cs262a-S16 Lecture-20 12 4/6/2016 Cs262a-S16 Lecture-20 13

#### **Writable Working Set**

4/6/2016 Cs262a-S16 Lecture-20 14

**Design Overview** 

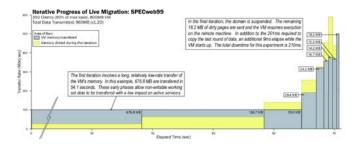

4/6/2016 Cs262a-S16 Lecture-20

#### **Handling Local Resources**

- · Open network connections
  - Migrating VM can keep IP and MAC address.
  - Broadcasts ARP new routing information
    - » Some routers might ignore to prevent spoofing
    - » A guest OS aware of migration can avoid this problem
- · Local storage
  - Network Attached Storage

4/6/2016 Cs262a-S16 Lecture-20 18 4/6/2016 Cs262a-S16 Lecture-20

# Complex Web Workload: SPECweb99

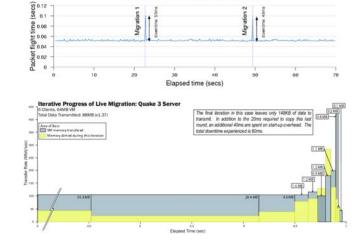

#### **Types of Live Migration**

- Managed migration: move the OS without its participation
- Managed migration with some paravirtualization
  - Stun rogue processes that dirty memory too quickly
  - Move unused pages out of the domain so they don't need to be copied

19

- Self migration: OS participates in the migration (paravirtualization)
  - Harder to get a consistent OS snapshot since the OS is running!

## **Low-Latency Server: Quake 3**

Packet interarrival time during Quake 3 migration

4/6/2016 Cs262a-S16 Lecture-20 20 4/6/2016 Cs262a-S16 Lecture-20 21

#### **Summary**

- · Excellent results on all three goals:
  - Minimize downtime/max availability, manageable total migration time, avoid active service disruption
- Downtimes are very short (60ms for Quake 3!)
- · Impact on service and network are limited and reasonable
- Total migration time is minutes
- Once migration is complete, source domain is completely free

4/6/2016 Cs262a-S16 Lecture-20

**BREAK** 

#### Is this a good paper?

- · What were the authors' goals?
- What about the evaluation/metrics?
- Did they convince you that this was a good system/approach?
- Were there any red-flags?
- · What mistakes did they make?
- Does the system/approach meet the "Test of Time" challenge?
- · How would you review this paper today?

23

#### Virtualization in the Cloud

- True "Utility Computing"
  - Illusion of infinite machines
  - Many, many users
  - Many, many applications
  - Virtualization is key
- Need to scale bursty, dynamic applications
  - Graphics render
  - DNA search
  - Quant finance

- .

4/6/2016 Cs262a-S16 Lecture-20 24 4/6/2016 Cs262a-S16 Lecture-20 25

22

#### **Application Scaling Challenges**

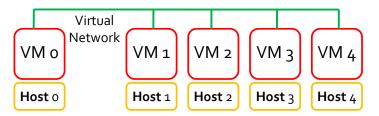

- · Awkward programming model: "Boot and Push"
  - Not stateful: application state transmitted explicitly
- Slow response times due to big VM swap-in
  - Not swift: Predict load, pre-allocate, keep idle, consolidate, migrate
  - Choices for full VM swap-in: boot from scratch, live migrate, suspend/resume
- · Stateful and Swift equivalent for process?
  - Fork!

4/6/2016 Cs262a-S16 Lecture-20 26

Fork has Well Understood Semantics

#### **SnowFlock: VM Fork**

Stateful swift cloning of VMs

- State inherited up to the point of cloning
- · Local modifications are not shared
- · Clones make up an impromptu cluster

partition data

fork N workers Parallel Computation if child:

work on ith slice of data

if more load:

fork extra workers Load-balancing Server if load is low:

dealloc excess workers

trusted code

fork if child:

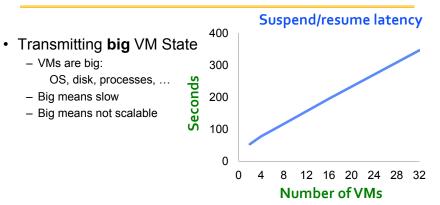

untrusted code

if cycles available:

fork worker Opportunistic if child: if computation do fraction of long computation VM Fork Challenge - Same as Migration!

Cs262a-S16 Lecture-20

27

 Same fundamental bottleneck issues as VM Migration – shared I/O resources; host and network

4/6/2016 Cs262a-S16 Lecture-20 28 4/6/2016 Cs262a-S16 Lecture-20 29

4/6/2016

#### **SnowFlock Insights**

- · VMs are BIG: Don't send all the state!
- Clones need little state of the parent
- Clones exhibit common locality patterns
- · Clones generate lots of private state

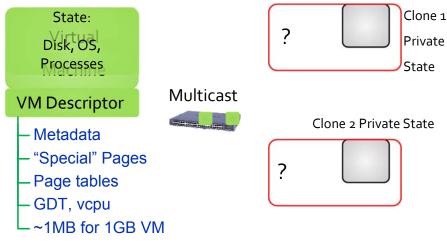

4/6/2016 Cs262a-S16 Lecture-20 30

#### **SnowFlock Secret Sauce**

4/6/2016

32

# g. Meditististscedephistilibetelehity/didup derivsticte

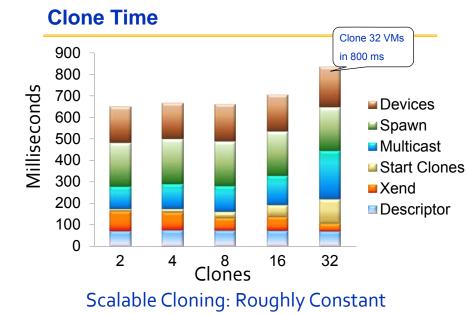

Cs262a-S16 Lecture-20

31

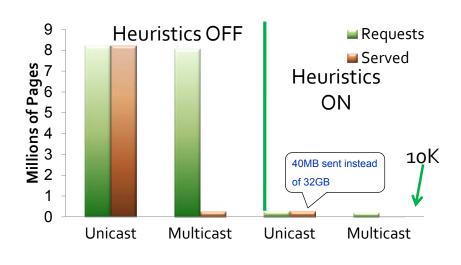

# Why SnowFlock is Fast

- · Start only with the basics
- Send only what you really need
- Leverage IP Multicast
  - Network hardware parallelism
  - Shared prefetching: exploit locality patterns
- Heuristics
  - Don't send if it will be overwritten
  - Malloc: exploit clones generating new state

4/6/2016 Cs262a-S16 Lecture-20 33

#### Page Fetching, SHRiMP 32 Clones 1GB

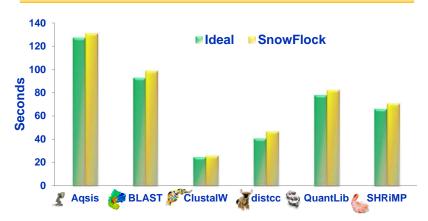

4/6/2016 Cs262a-S16 Lecture-20 34

#### **Application Evaluation**

- Embarrassingly parallel
  - 32 hosts x 4 processors
- CPU-intensive
- Internet server
  - Respond in seconds
- Bioinformatics
- · Quantitative Finance
- Rendering

4/6/2016 Cs262a-S16 Lecture-20 35

### **Application Run Times**

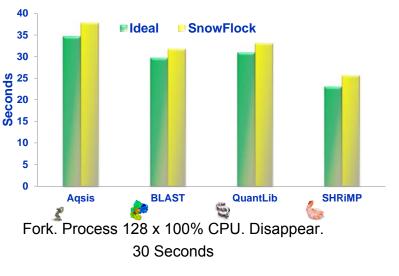

≤ 7% Runtime Overhead ~ 5 seconds

# **Throwing Everything At It**

- · Four concurrent sets of VMs
  - BLAST, SHRiMP, QuantLib, Aqsis
- · Cycling five times
  - Clone, do task, join
- · Shorter tasks
  - Range of 25-40 seconds: interactive service
- · Evil allocation

4/6/2016 Cs262a-S16 Lecture-20 36 4/6/2016 Cs262a-S16 Lecture-20 37

#### **Throwing Everything At It**

4/6/2016 Cs262a-S16 Lecture-20 38

# Is this a good paper?

- · What were the authors' goals?
- · What about the evaluation/metrics?
- Did they convince you that this was a good system/approach?
- Were there any red-flags?
- · What mistakes did they make?
- Does the system/approach meet the "Test of Time" challenge?
- · How would you review this paper today?

#### **Summary: SnowFlock In One Slide**

- · VM fork: natural intuitive semantics
- · The cloud bottleneck is the IO
  - Clones need little parent state
  - Generate their own state
  - Exhibit common locality patterns
- No more over-provisioning (pre-alloc, idle VMs, migration,
  - Sub-second cloning time
  - Negligible runtime overhead
- Scalable: experiments with 128 processors
