

EECS 219C:
Formal Methods
Introduction & Overview

Sanjit A. Seshia
EECS, UC Berkeley

Buying a Car

Does the car do
what it is supposed to do?

The Engineer's Perspective

Does the implemented system meet its specifications?

The Mathematician's Perspective

Prove or disprove (verify) that
the mathematical model of the system
satisfies a **mathematical specification**

$$\dot{x}(t) = f(x(t), u(t))$$

Formal Verification (informally)

**Does the system do
what it is supposed to do?**

Formal Methods

Rigorous mathematical / algorithmic techniques for specification, design, verification and maintenance of computational systems.

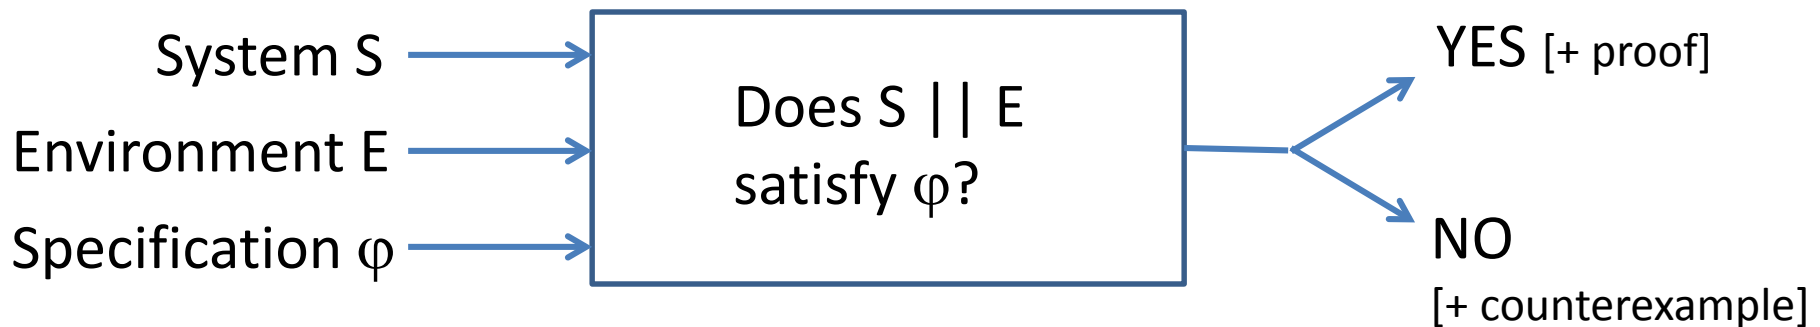

The essence: It's about **PROOF**

- **Specify** proof obligations
- **Verify**/prove that system meets those obligations
- **Synthesize** provably-correct system

The Formal Methods Lens

- Formal Methods \approx Computational Proof methods
 - Specification/Modeling \approx Statement of Conjecture/Theorem
 - Verification \approx Proving/Disproving the Conjecture
 - Synthesis \approx Generating (parts of) Conjecture/Proof
- Tools/techniques: SAT / SMT solvers, model checkers, theorem provers, simulation-based falsification, ...

Verification:

Three Key Areas of Formal Methods

- Specification
 - WHAT must the system (program) do?
 - includes Modeling
- Verification
 - WHY does the system do it? (or not)
- Synthesis
 - HOW does the system do it?

What we'll do today

- Introductions: to Sanjit and others
- Brief Intro. to the main course topics
 - Motivation
 - Basics: Propositional Logic, First-Order Logic, Temporal Logic, Model Checking, SAT, Satisfiability Modulo Theories (SMT), ...
 - History, Opportunities, Challenges
- Course Logistics

My Research

“Formal Methods: Specification, Verification, Synthesis”

Theory

Computational Logic,
Algorithms,
Learning Theory,
Optimization

+

Practice

CAD for Circuits/Bio,
Computer Security,
Embedded/Cyber-Physical
Systems, Education

Current Foci: Verified Intelligent (AI) Systems /
Secure Systems

Class Introductions

Please introduce yourselves

-- state name and research interests/areas
(Programming Systems, Computer Security,
Arch/CAD, Embedded Systems/CPS,
BioSystems, Control Theory, AI, ML,
Robotics, etc.)

Formal Verification

- Automatically verifying the correctness of systems

- Questions for today:
 - Is it relevant?
 - Is it feasible?
 - What will we study?

Ariane disaster, 1996
\$500 million software failure

Toyota Recalls 1.9 Million Prius Hybrids Over Software Flaw

By Jeremy Hsu

Posted 12 Feb 2014 | 21:55 GMT

**Bugs cost Time, Money,
Lives, ...**

```
<msblast.exe> (the primary executable of the exploit)
I just want to say LOVE YOU SAN!!
billy gates why do you make this possible ? Stop
making money and fix your software!!
windowsupdate.com
start %s
tftp -i %s GET %s
%d.%d.%d.%d
%i.%i.%i.%i
```

**Estimated worst-case worm cost:
> \$50 billion**

Is Verification Feasible?

- “Easiest” non-trivial verification problem is NP-hard (SAT)
- But the outlook for practice is less gloomy than for theory...
 - More hardware resources
 - Better algorithms

My Experience with SAT Solving

(over ~a decade)

Speed-up of 2012 solver over other solvers

Experience with SPIN Model Checker

[G. Holzmann]

some algorithmic improvements in the last two decades

tpc – a logic model of a telephone switch

Topics in this Course

- Computational Engines / Basic Topics
 - Boolean satisfiability (SAT)
 - Satisfiability modulo theories (SMT)
 - Model checking
 - Syntax-guided synthesis (SyGuS)
- Advanced Topics (“Research Frontiers”)
 - Deduction + Inductive Learning
 - Safe/Verified Artificial Intelligence (AI)
 - Human-Robot/Computer Interaction & Formal Methods
 - New application domains
 - ... (more later in this lecture)

Topics of this Course (another view)

Application Domains

**Circuits, Software, Networks, Hybrid
Systems, Biological Systems, etc.**

Verification/Synthesis Strategies

**Automata-theoretic, Symbolic,
Abstraction, Learning, etc.**

Computational Engines

SAT, BDDs, SMT

Boolean Satisfiability (SAT)

**Is there an assignment to the p_i variables
s.t. ϕ evaluates to 1?**

Two Applications of SAT

- Equivalence checking of circuits
 - Given an initial (unoptimized) Boolean circuit and its optimized version, are the two circuits equivalent?
 - Standard industry CAD problem
- Malware detection (security)
 - Given a known malicious program and a potentially malicious program, are these “equivalent”?
- Many other applications:
 - Cryptanalysis, test generation, model checking, logic synthesis,

Satisfiability Modulo Theories (SMT)

Is there an assignment to the x, y, z, w variables s.t. ϕ evaluates to 1?

Applications of SMT

- Pretty much everywhere SAT is used
 - The original problem usually has richer types than just Booleans!
- To date: especially effective in
 - software model checking
 - test generation
 - software synthesis
 - finding security vulnerabilities
 - high-level (RTL and above) hardware verification

Model Checking

- Broad Defn:

A collection of **algorithmic methods** based on **state space exploration** used to verify if a **system satisfies a formal specification**.

- Original Defn: (Clarke)

A technique to check if a finite-state system is a model of (satisfies) a temporal logic property.

Visualizing Model Checking

Model Checking, (Over)Simplified

- Model checking “is” graph traversal ?
- What makes it interesting:
 - The graph can be HUGE (possibly infinite)
 - Nodes can represent many states (possibly infinitely many)
 - How do we generate this graph from a system description (like source code)?
 - Behaviors/Properties can be complicated (e.g. temporal logic)
 - ...

A Brief History of Formal Methods

(PREAMBLE)

Focus on (Highly) Automated Formal Methods

- 1949: Early program proof by Alan Turing
- 50s & 60s: Lot of relevant work on automata theory by several researchers (e.g. Buchi, Rabin, ...)
- 1967: paper on proving program assertions by Floyd
- 1969: Tony Hoare's paper on logic-based reasoning to prove programs correct (or not)
- Early 70s: lots of work on proving sequential programs correct

A Brief History of Formal Methods

(biased towards model checking)

- 1977: Pnueli introduces use of (linear) temporal logic for specifying program properties over time [1996 Turing Award]
- 1981: Model checking introduced by Clarke & Emerson and Quielle & Sifakis
 - Based on explicitly traversing the graph
 - capacity limited by “state explosion”
- 1986: Vardi & Wolper introduce “automata-theoretic” framework for model checking
 - Late 80s: Kurshan develops automata-theoretic verifier
- Early - mid 80s: Gerard Holzmann starts work on the SPIN model checker

A Brief History of Formal Methods

(biased towards model checking)

- 1986: Bryant publishes paper on BDDs
- 1987: McMillan comes up with idea for “Symbolic Model Checking” (using BDDs) – SMV system
 - First step towards tackling state explosion
- 1987-1999: Flurry of activity on finite-state model checking with BDDs, lots of progress using: abstraction, compositional reasoning, ...
 - More techniques to tackle state explosion
- 1990-95: Timed Automata introduced by Alur & Dill, model checking algorithms introduced; generalized to Hybrid Automata by Alur, Henzinger and others

A Brief History of Formal Methods

- 1999: Clarke et al. introduce “Bounded Model Checking” using SAT
 - SAT solvers start getting much faster
 - BMC found very useful for debugging hardware systems
- 1999: Model checking hardware systems (at Boolean level) enters industrial use
 - IBM RuleBase, Synopsys Magellan, 0-In FV, Jasper JasperGold
- 1999-2004: Model checking + theorem proving: software and high-level hardware comes of age
 - SLAM project at MSR, SAL at SRI, UCLID at CMU
 - Decision procedures (SMT solvers) arise
 - Software verifiers: Blast, CBMC, Bandera, MOPS, ...
 - SLAM becomes a Microsoft product “Static Driver Verifier”

A Brief History of Formal Methods

(biased towards model checking)

- 2005-date: Model Checking is part of the standard industrial flow. Some new techniques and applications arise:
 - Combination with simulation (hardware) and static analysis/testing (software) [Many univ/industry groups]
 - Checking for termination in software [Microsoft]
 - Lots of progress in verification of concurrent software [e.g. Microsoft CHES project]
 - SMT solvers get much faster and better
- Inductive synthesis [Berkeley, Microsoft, MIT, Penn, ...]
 - 2006: Counterexample-guided inductive synthesis (CEGIS) and sketching-based synthesis developed at Berkeley
 - 2010: First example-driven “oracle-guided synthesis” method [Berkeley+SRI+Microsoft]
 - 2010s: End-user programming [Microsoft, etc.], Inductive synthesis for specification inference [Berkeley, Toyota], etc.
 - 2013-date: Syntax-Guided Synthesis (SyGuS) arrives

Recent Recognition for the Field

- Clarke, Emerson, Sifakis get ACM Turing Award for Model Checking; SAT solving advances are recognized; Turing Award for Lamport (in part for Specification/Verification work)

WHAT'S NEXT?!

Research Frontiers in Formal Verification

- Three Themes:
 - New Demands on Computational Engines
 - New Applications
 - The “Human Aspect”
 - Steps that require significant human input
 - Systems with humans in the loop
- suggested project topics by mid-Feb

Formal Methods meets Machine Learning

- Machine Learning → Formal Methods
 - Greater efficiency, ease of use/applicability
 - Formal Inductive Synthesis
- Formal Methods → Machine Learning
 - Stronger assurances of safety/correctness for learning systems

Further details:

Formal Methods for Education

Goal: To enable personalized learning for lab-based courses in science and engineering → CPSGrader, deployed on edX and on campus

The image shows a LabVIEW interface for a robot simulation. The window title is "CyberSim". It has three tabs: "Statechart Display", "Feedback and Grading", and "Configuration". The "Configuration" tab is active, showing fields for "environment" (Environment - Navigation and Hill Climb 1.xml), "statechart" (..\src\LabVIEW\Statechart\Simulation Statechart.vi), and "record" (Simulation Record.xml). A "feedback mode" dropdown is set to "debug hill clim". A "Save Configuration" button is at the bottom of the configuration panel. Below the configuration panel, a status bar shows "simulation running" with a green indicator, "sequence number 0", and "simulation time (s) 0.000". The main simulation area is a large black rectangle with the word "Simulation" in white text. To the right is a 3D model of a robot with various sensors and actuators: "Front Left Cliff", "Front Right Cliff", "Wall", "Left Bump", "Right Bump", "Caster Wheel Drop", "Net Dist (mm)", "Net Angle (deg)", "Left Cliff", "Right Cliff", "Left Wheel (mm/s)", "Right Wheel (mm/s)", "Left Wheel Drop", "Right Wheel Drop", and "accelerometer". The accelerometer is a small window with a black background and a green border, showing a plot of acceleration over time. At the bottom right, there are control buttons: "Start", "Camera", "Check Grade", "Pause", "Stop", and "Exit". A "LabVIEW" logo is visible in the bottom left corner of the simulation area.

Formal Methods for Secure Systems

- Does my secret data remain secret?
- Does the program execute as it is supposed to?
- Is the right program executed?

Course Logistics

- Check out the webpage:
www.eecs.berkeley.edu/~sseshia/219c
- Tentative class schedule is up
 - **IMP: Think about project topics!**

Course Outline

- 2 parts
- Part I: Model Checking, Theorem Proving, Boolean reasoning (SAT, BDDs), SMT
 - Basics, how to use these techniques, and how to extend them further
- Part II: Advanced Topics
 - The challenging problems that remain to be addressed

Reference Books

- No textbook; course notes from previous years
- See list on the website
- Readings for most material posted on bCourses

Grading

- Homework (30%)
 - First part of the course
- Scribing lectures – maybe (?)
 - 2 lectures per person: Scribe one lecture, edit another lecture
 - Sign-up sheet next week
- Paper discussions / class participation (20%)
 - Usually last month of the course
- **Project (50%)**
 - Do original research, theoretical or applied
 - Sample topics will be announced by end of next week
 - Project proposal due mid Feb.
 - Culminates in final presentation + written paper
 - *~50% of past projects led to conference papers!*

Misc.

- Office hours: M 2:30-3 pm, W 2:30-4 pm, and by appointment
- Pre-requisites: check webpage; come talk to me if unsure about taking the course
 - Undergraduates need special permission to take this class
